

Work out a price for your product

There are a number of ways to arrive at the price to charge customers. Regardless of which method you use for pricing your product, you'll need to know what it costs to supply your product to be sure you're able to operate at a profit. Alternatively, you'll need to know the cost to your business if you plan to sue a product as a loss leader.

Work out your costs

The first step is always to work out what it costs you to supply the product. To do this, you'll need to work out the direct and indirect costs (also known as the fixed and variable costs) involved in producing and supplying your product.

A manufacturer, for example, would need to work out the total cost of all the materials used to create the product, as well as a portion of costs such as salaries and wages (including production and administrative staff), rent and levies, transport and insurance, office supplies and utility accounts.

The cost for a retailer would include the cost price of the product, or products if you're bundling products together as a package, and a portion of the overhead costs including wages, advertising, rental costs and the like.

Ask your accountant or financial adviser to check your figures to make sure you haven't overlooked any important costs.

Cost plus pricing

With the cost-plus pricing model, you add on a fixed percentage of the cost price to provide you with an acceptable level of profit. Manufacturers will often add between 40 and 50 percent to the cost price of a product to arrive at the selling price. So, if it costs \$20.00 to produce an item it will sell for between \$28. and \$30.

Cost plus pricing works best in a market where there is a lot of price competition and high sales volumes. Be aware that this model is based on input costs and ignores other

factors such as customer perception of quality, what the market would pay for the product and what your competitors are charging.

Value based pricing

With the value based pricing model, your price is not based on cost but on what you believe customers would be prepared to pay for the product. The value based model gives you the flexibility to arrive at a price that is higher than the cost plus model, allowing you to charge for the perceived value of your product.

Value base pricing works best in a market where you have a distinct advantage over your competitors and where you have established customers who are prepared to pay a premium for your product – either because of quality, being first to market with the latest technology, or providing organic or eco-friendly options not provided by your competitors.

Competitor based pricing

With the competitor based pricing model, you'll base the price of your product relative to the price your competitors are charging. If you believe you have a market advantage and people perceive your product as superior, you might decide to set your price slightly above the level, or just below that, of the lowest prices charged by your competitors.

If you want to be perceived as offering good quality at a reasonable price, you might pitch your product price at around 10 to 20 percent below your market leading competitors. And if you want to be seen as offering value for money, you might pitch your price around the level, or just below that of the lowest prices charged by your competitors.

Prestige pricing

If you are first to market with a new product or have a well-known brand, you can consider prestige pricing. Much like the value based pricing model, you charge what you think your customers will pay – adding a premium for the prestige associated with buying a top fashion brand or cutting edge technology.

Most small businesses are not likely to use this pricing model, but you can consider it if you develop a leading brand or develop a market leading product.

Loss leader pricing

One fairly common tactic is to lure customers to your store with a loss leader. With the loss leader pricing model, you price a product sufficiently below the price of your competitors, sometimes even below cost, to encourage customers to come and buy from your store with the expectation that once there, they will buy other items at the normal price.

Supermarkets are well known for using loss leaders on everyday price sensitive products, such as milk and bread, on the assumption that most people will buy other groceries once in the store.

Loss leaders can be an effective way to attract new customers but you need to ensure that you make enough other sales to benefit from it. If people only buy the loss leader product from you and never visit your store again, you will lose money.

Discounts

Offering discounts such as 20 percent off for a limited period can be an effective way to increase sales, but discounting shouldn't become so regular that people expect it. If you offer regular, predictable discounts, your customers will soon learn to wait for your regular sale rather than buy the product at your normal list price.

It's also interesting to note that most customers perceive a free gift as being of more value than a discount – so consider offering a sample product free with a purchase rather than simply offering a discount.
